

Columbia Combined Cable Tray Styles

Overview

Choose from our selection of cable trays, including over 850 products in a wide range of styles and sizes. Same and Next Day Delivery.

Key Takeaways

Columbia Combined Cable Trays typically include ladder, perforated, solid-bottom, wire mesh, and channel styles, available in various materials for diverse industrial and commercial applications.

Ladder Trays Ladder trays feature two longitudinal side rails connected by transverse rungs, resembling a ladder. They are ideal for heavy power cables and long runs, providing excellent ventilation to dissipate heat generated by high-current cables. Ladder trays support significant cable loads over long spans and are commonly used in industrial and utility-scale installations .

Perforated Trays Perforated trays have a solid base with regularly spaced holes, offering moderate ventilation while providing continuous support for cables. They are suitable for mixed cable types, including power, control, and instrumentation cables, and are often used where some airflow is needed but full exposure is not desirable .

Solid-Bottom Trays Solid-bottom trays provide maximum protection for cables against dust, moisture, and mechanical damage. They are ideal for sensitive or low-voltage cables in harsh environments, such as chemical plants or areas with high contamination risk .

Wire Mesh (Basket) Trays Wire mesh trays are constructed from welded steel wires forming an open mesh. They are lightweight, flexible, and highly ventilated, making them perfect for data centers, telecommunications, and control wiring. Their open design allows easy cable routing, maintenance, and upgrades .

Channel Trays Channel trays have a U-shaped or channel-like structure, suitable for light cable loads and tight spaces. They are compact, cost-effective, and often used for short cable runs or in residential and small commercial projects .

Material Options

Columbia Combined Cable Trays are available in multiple materials to suit environmental conditions:

- **Aluminum:** Lightweight, corrosion-resistant, and strong, ideal for outdoor or humid environments .
- **Steel:** Provides good electrical shielding and mechanical strength; can be pre-galvanized or hot-dip galvanized for corrosion protection .
- **Stainless Steel (AISI 316L):** Highly resistant to corrosion, suitable for marine or chemical environments .
- **Fiberglass Reinforced Plastic (FRP):** Non-conductive, corrosion-resistant, and lightweight, ideal for chemical plants or areas with high moisture .

Key Considerations

When selecting a cable tray style, consider:

- **Cable type and weight:** Heavy power cables require ladder trays, while light control cables may use channel or wire mesh trays.
- **Heat dissipation:** Open designs like ladder and wire mesh trays allow better airflow.
- **Environmental exposure:** Corrosive or wet environments may require stainless steel, aluminum, or FRP trays.
- **Space constraints:** Channel trays are suitable for confined areas.

- Maintenance and future expansion: Open trays facilitate easy access for adding or rerouting cables. Columbia Combined Cable Trays provide a versatile solution for industrial, commercial, and data center applications, combining structural support, cable protection, and flexibility for future modifications.
