

How to run fiber optic cables through an explosion-proof box

Overview

Fiber Optic Cable in Hazardous Locations: Class I Division 1 and 2 Fiber optic cable is inherently safe in explosive atmospheres because it carries no elect.

Key Takeaways

Fiber optic cables can be safely run through an explosion-proof box by using certified enclosures, proper cable glands, and protective routing that complies with IECEx, ATEX, and IEC 60079-28 standards. Use Certified Explosion-Proof Enclosures

Choose a fiber optic splice or termination box specifically designed for hazardous areas, such as the BXJ93 Fibre Optic Splice Box. These enclosures are certified for Zone 1 and Zone 2 explosive atmospheres, constructed from stainless or carbon steel, and rated IP66 for dust and water ingress protection. Ensure the box has multiple gland entry options and internal splice trays to manage fiber routing safely.

Select Proper Cable Protection

Fiber optic cables must be protected from mechanical damage, over-bending, and environmental hazards. Use rigid or flexible conduits to prevent bending and breaking, and consider armored cables for additional protection. The enclosure and conduits should maintain the Ex op pr (protected) principle, ensuring that the light signal remains contained and cannot ignite the surrounding atmosphere.

Follow Optical Safety Standards

Even though fiber optics do not conduct electricity, high-power light can pose an ignition risk if a cable is damaged. Adhere to IEC 60079-28, which limits optical power in hazardous zones (e.g., 35 mW for Zone 1, IIB, T4) and defines protective concepts like op is (intrinsically safe) and op pr (protected) . Avoid reducing cable cross-sections or altering fiber geometry, as this can concentrate light and increase ignition risk.

Use Certified Cable Glands and Connectors

Install ATEX or IECEx-approved cable glands and connectors to maintain the explosion-proof integrity of the box. Products like Amphe-EX™ connectors allow fiber signals to pass through Zone-rated areas while maintaining safety compliance . Ensure all external connections are properly sealed and certified for the specific hazardous zone.

Installation Best Practices

- Route fibers in conduits or armored cables to prevent accidental damage.
- Avoid sharp bends and maintain the minimum bend radius specified by the manufacturer.
- Use hinged covers and captive screws for easy inspection without compromising safety .
- Ensure all splices and terminations are inside the explosion-proof enclosure.
- Verify that the installation complies with ATEX, IECEx, and local hazardous area regulations. By following these steps, fiber optic cables can be safely installed through an explosion-proof box, maintaining both operational integrity and compliance with hazardous area safety standards.
