

How to test fiber optic cable connector loss

Overview

The FOA Reference For Fiber Optics Testing for loss (also called "insertion loss") requires measuring the optical power lost in a cable (including Guidelin.

Key Takeaways

Fiber optic connector loss is measured using a light source and power meter setup, comparing transmitted power through the connector to a reference to determine insertion loss.

Required Tools and Equipment

- Test Source: LED or laser source appropriate for the fiber type and wavelength (e.g., 850/1300 nm for multimode, 1310/1550 nm for singlemode) .
- Optical Power Meter: Calibrated for the same wavelength as the source .
- Reference Test Cables: Known good cables of the same fiber type and connector type .
- Mating Adapters: Compatible with the connectors being tested .

Cleaning Supplies: Lint-free wipes and alcohol to clean connectors and adapters .

Step-by-Step Procedure

- Prepare Equipment: Turn on the source and power meter, allowing them to warm up. Ensure all reference cables are tested for integrity using a single-ended loss test .
- Clean Connectors: Thoroughly clean all connectors and mating adapters to prevent contamination from affecting measurements .

- **Set Reference Power:** Connect the launch reference cable to the source and the receive reference cable to the power meter. Measure the power and set this as the 0 dB reference .
- **Connect Cable Under Test:** Attach the cable under test between the launch and receive reference cables using mating adapters. Measure the power at the meter .
- **Calculate Connector Loss:** The difference between the reference power and the measured power is the insertion loss of the connector(s) .
- **Test Both Ends:** For short patch cords, reverse the cable and repeat the measurement to determine the loss of the connector on the other end .

Additional Tips

- **Use Hybrid Adapters** if the test equipment connectors differ from the cable plant connectors .
- **Document Results:** Record the measured loss for each connector to ensure compliance with network specifications .
- **OTDR Testing:** For long cables with splices, an OTDR can verify individual splice and connector losses, though discrete connector testing is generally not required for overall link performance . By following this procedure, you can accurately measure the insertion loss of fiber optic connectors, ensuring the cable plant meets performance standards and minimizing signal degradation in the network.
