

Methods for bending distribution boxes

Overview

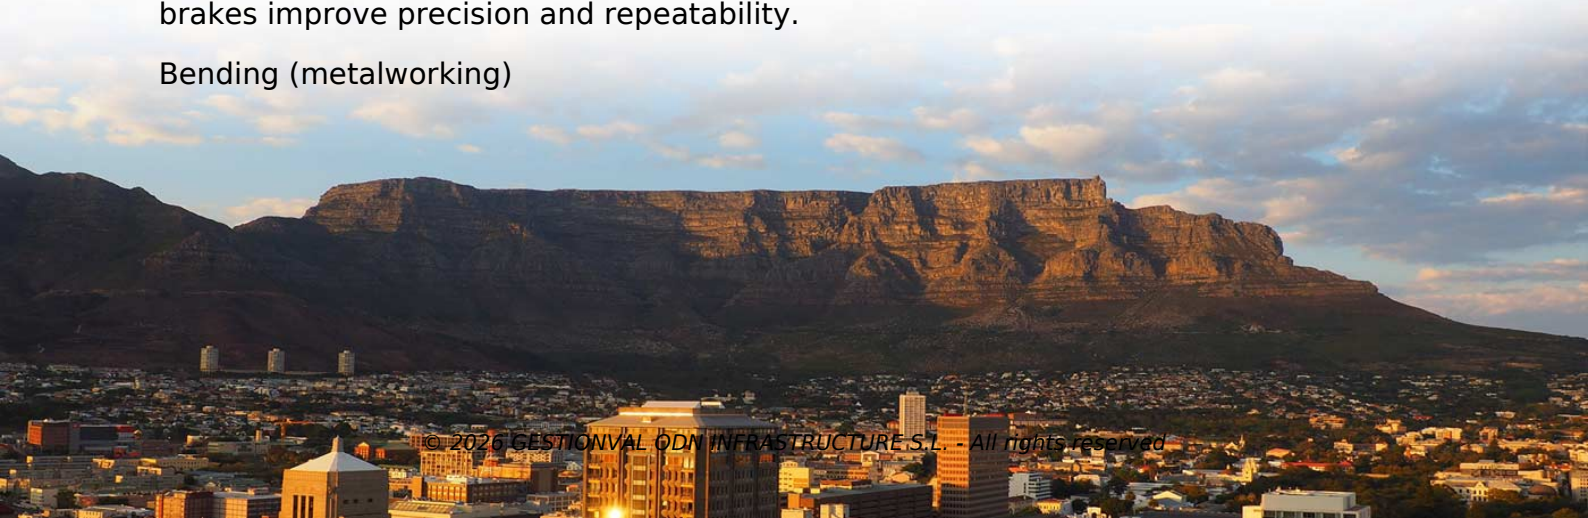

Commonly used equipment include box and pan brakes, brake presses, and other specialized machine presses. Typical products that are made like this are boxes such as electrical enclosures and rectangular ductwork. This guide explains how to bend a box with a press brake, which tooling to use, correct bend sequence, common mistakes to avoid, and how modern CNC press brakes improve precision and repeatability. In this video, you can see its whole bending process by this flexible panel bender. Techniques for bending distribution boxes often involve. Window bending does not however help with 3 or 4 sided boxes. There are some types of 3 sided boxes which can be bent by 'hanging' the work piece off of the end of the brake, allowing the 3 bend to clear the upper beam because it is to the side of it. This method could be made difficult depending.

Bending (metalworking)

There are three basic types of bending on a press brake, each is defined by the relationship of the end tool position to the thickness of the material. These three are Air Bending, Bottoming and Coining. The configuration of the tools for these three types of bending are nearly identical. A die with a long rail form tool with a radiused tip that locates the inside profile of the bend is called a punch. Punches are usually attached
