

Straight-line construction of cable trays

Overview

Straight Sections: The long, straight lengths of tray that form the main cable runs. They are available in various standard lengths. **Fittings (Bends and Tees):** These components allow the system to change direction and branch out. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray is intended for instrumentation and control applications that require. Is your cable tray system optimized for safety, dependability, space and cost savings?

Cable tray (or cable ladder) systems are a popular alternative to electrical conduit systems, as they have an outstanding record for dependable service, design flexibility and cost savings in commercial and industrial applications. Hubbell's NEXTFRAME® Ladder Tray is the effective and widely used cable runway that supports and delivers bundles of cable between cabinets, racks, and closets, along walls, and suspended from ceilings. It is designed for this role—the role of the cable tray system—a structured framework designed to support and organize insulated electrical cables, control cables, and communication lines. Far superior to traditional conduit in many applications, cable tray systems offer unparalleled accessibility for maintenance. The Cable Tray Institute (CTI) was founded in 1991 to support the cable tray industry by engaging in research, development, education, and the dissemination of information designed to promote, enhance, and increase the visibility of the industry. Eaton's submittal builder tool.
